Best Practices for Managing Device Health

Updated July 7, 2026 at 11:41 PM

See the following topics to learn more about best practices for managing device health.

- Device Health Management Workflow
- Return-Merchandise Authorization (RMA) Best Practices
- Health Reports
- Recommended Continued Monitoring

Guided Resources

To learn more about the different types of health reports available in the Samsara dashboard, watch the Quick Tip: Device Health Reports video.

Device Health Management Workflow

Establishing a regular cadence of reviewing device health and taking recommended actions helps ensure that the necessary data is available when needed. To maintain optimal device health, Samsara recommends the following practices:

- Weekly: Review devices in the **Needs Attention** category (see the Gateway Health Report) and perform the recommended actions.
- Monthly: Review devices in the Monitor category to address issues proactively (for example, low battery).

To ensure efficient issue resolution and device management, consider assigning responsibility for the following areas:

- Support coordination, including opening tickets with Samsara Technical Support and managing hardware troubleshooting
- Device lifecycle management, such as activation, configuration, naming, and tagging
- Field operations, including device installation and hardware returns to Samsara

Return-Merchandise Authorization (RMA) Best Practices

After troubleshooting is complete and you confirm that you need a replacement device, complete the RMA Checklist and include the checklist information when you open a support ticket with Samsara Technical Support. See Report an Issue.

Health Reports

Use the following health reports to monitor your devices and accessories:

- Vehicle Gateway (VG) Device Health: Definitions and Troubleshooting
- Camera Device Health: Definitions and Troubleshooting
- Sensor Device Health: Definitions and Troubleshooting

Recommended Continued Monitoring

Use alerts and scheduled reports to actively monitor device health. Additional reports, such as the Visual Review Report, can provide insight into c visibility.

- *Scheduled Reports* enable you to configure a report to be sent to a group of internal or external recipients on a daily, weekly, or monthly basi For example, you can schedule Samsara to send the Gateway Health Report to a group on a regular basis.

Camera Obstruction feature checks for violations just after a trip starts (not continuously). This feature is only available for dual-facing dash cams.

- You can create and manage *alerts* to increase operational efficiency with complete visibility into fleet performance and driver behavior. The Alert Guide lists the alerts you can configure on your dashboard. The following are specifically related to device health:
    - **Vehicle Unplugged**: In the event that a vehicle gateway is unplugged from its vehicle, this alert will be triggered.
    - **Device Battery Level**: If the battery is low on the device the Admin will be notified.
    - **Dash Cam Disconnected**: In the event that the Dash Cam is disconnected an alert will trigger.
    - **Connection**: The Connection alert is triggered when the device is offline for either 15 mins or 60 mins based on your preference.
