Create an Automation Workflow

Updated March 31, 2026 at 12:04 AM

Automations enable you to build and customize workflows across Samsara products—from simple alerts to complex, multi-step processes. Automations include full feature parity with existing alerts, so you can continue to create the same real-time, condition-based notifications you rely on today, while also expanding into more advanced workflows when needed.

Using a no-code builder, you can define condition-based logic that automatically triggers actions when specific events occur—helping reduce manual work, improve response times, and ensure consistent operations at scale.

Samsara provides prebuilt automation templates to help you get started quickly with common workflows, such as safety, compliance, and maintenance use cases. You can customize a template by duplicating it, or build an automation from scratch to create a workflow tailored to your specific operational needs. Automations connect real-time Samsara data—such as safety events, compliance conditions, inspections, asset state, or scheduled checks—to actions like notifications, training assignments, work order creation, in-cab alerts, or integrations with third-party systems.

Requirements to View and Configure Automations

- Access roles: Full Admin role, or a custom role with permissions to create, edit, and view automations.

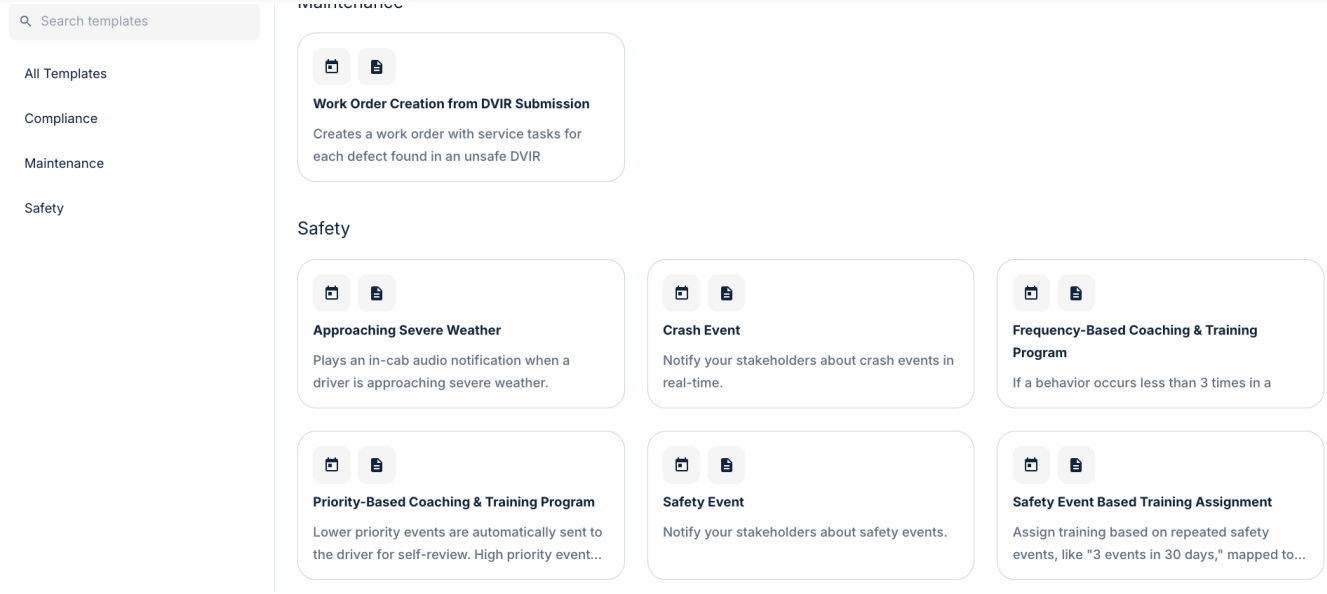

> **Note**
>
> Automations are owned by the user who creates them and always run under that user's access scope. Only users with the same or broader scope can edit an automation.

- Safety workflows also require:
  - Safety ENT license or higher
  - Dash cam models: CM31, CM32, CM33, or CM34

Create a New Automation from a Template

Follow these steps to create and customize an automation workflow.

1. Select the Settings icon (⚙) at the bottom of your Fleet menu to view dashboard settings.
2. Go to **Organization > Automations**.
3. Click **+ New Automation**.
   You can also duplicate an existing automation. To do so, select the more actions (•••) menu and choose **Duplicate**.
4. Select a template to customize a prebuilt workflow.

5. Select a trigger for the automation and define any conditions or filters.
6. Add trigger modifiers such as geofence, engine state, or time filters.
7. Choose one or more actions, such as sending alerts or assigning training.
8. Use conditional branching if needed. Branches execute in order from left to right; only the first match runs.
9. Check for errors in the configuration. Click highlighted sections to resolve them.
10. **Save** to finalize the automation.

Create a New Automation From Scratch

1. Select the Settings icon (⚙) at the bottom of your Fleet menu to view dashboard settings.
2. Go to **Organization > Automations**.
3. Click **+ New Automation**.
   You can also duplicate an existing automation. To do so, select the more actions (•••) menu and choose **Duplicate**.
4. Select **Build without template** to start a new automation.
5. Use the wizard to define when the automation runs and what actions it should perform.
   To learn more about the components used in an automation workflow, see Automation Building Blocks.
   a. Select a trigger for the automation and define any conditions or filters.
   b. Add trigger modifiers such as geofence, engine state, or time filters.
   c. Choose one or more actions, such as sending alerts or assigning training.
   d. Use conditional branching if needed. Branches execute in order from left to write; only the first match runs.
6. Check for errors in the configuration. Click highlighted sections to resolve them.
7. **Save** to finalize the automation.
